Product Description

The BDA4710V/BDA4710VT is a broadband, Highly accurate 50Ω digital step attenuator model which provides adjustable attenuation from 0 to 31.75 dB in 0.25 dB steps. The control interface supports a 7-bit serial interface with 3-bit addressable function and latched parallel interface.

BDA4710V/BDA4710VT supports a broad operating frequency range from 1MHz to 9.0 GHz. BDA4710V/BDA4710VT is offering the High linearity, low power consumption, high attenuation accuracy and low insertion loss, typically less than 3.0dB up to 8.5GHz.

The device features a safe state transitions with no negative/positive Glitch technology optimized for excellent step accuracy.

Basically the RF input and output are internally matched to 50 Ω and do not require any external matching components. In some cases to optimize Return loss for above 4 - 8.5GHz, Shunt capacitor can be added near RF1 and RF2 respectively. The design is bi-directional; Therefore, the RF input and output are interchangeable.

The BDA4710V/BDA4710VT does not require blocking capacitors. If DC is presented at the RF port, add a blocking capacitor. This is packaged in a RoHS2-compliant with QFN surface mount package.

The BDA4710V/BDA4710VT is AEC-Q100 Grade 2 qualified.

1. RF pins 7 and 18 must be at 0V DC. The RF pins do not require DC blocking capacitors for proper Operation if the 0V DC requirement is met.

2. It is recommended to ground the D0 ~ D6 in serial mode.

Programming Options

BDA4710V/BDA4710VT can be programmed using either the parallel or serial interface, which is selectable via P/S pin(Pin3).

Serial mode is selected by pulling it to a voltage logic HIGH and parallel mode is selected by setting P/S to logic LOW

Serial Control Mode

The serial interface is a 16-bit shift register to shift in the data LSB (D0) first. When serial programming is used, It is recommended all the parallel control input pins (26, 27, 28, 29, 30, 31, 32) are grounded. It is controlled by three CMOS-compatible signals: SERIN, Clock, and Latch Enable (LE).

Figure 4. Serial Mode Timing Diagram

BDA4710V/BDA4710VT Serial mode is selected by pulling it to logic HIGH. The serial interface is a 16-bit shift register made up of two words. The first 8-bit word is the Attenuation word, which controls the DSA state. The second word is the address word, which uses only 3 of 8-bits that must match the hard wired A0-A2 programming in order to change the DSA state. If no external connections are made to A0 – A2 then internally they will default to 000 due to internal pull down resistors. If these 3 external preset address bits are not matched with the SPI loaded address bits then the current attenuator state will remain unchanged. This allows up to 8 serial-controlled devices to be used on a single board, which share a common SERIN, CLK and LE.

When serial programming is used, all the parallel control input pins 26 – 32 can be left open or grounded.

Serial Register Map

The BDA4710V/BDA4710VT can be programmed via the serial control on the rising edge of Latch Enable (LE) which loads the last 8-bits attenuation word and 8-bits address word in the SHIFT Register. Data is clocked in LSB(D0) first.

The shift register must be loaded while LE is kept LOW to prevent changing the attenuation value during data is inputted.

Figure 5. Serial Register Map

The serial register consist of 16 bits as shown in Figure 5. First 8 bits from LSB are Attenuation word, 8 bits after that are Address word. The Attenuation word is DSA attenuation control bit and the Address word is static logical bit determined by A0, A1 and A2 digital inputs. The attenuation word is derived directly from the value of the attenuation state. To find the attenuation word, multiply the value of the state by four because of 0.25dB step up to 31.75dB (total 127 Attenuation state), then convert to binary.

For example, to program attenuation 15.75dB state of Addr[5] BDA4710V/BDA4710VT :

Power-UP states Settings

The BDA4710V/BDA4710VT will always initialize to the maximum attenuation setting (31.75 dB) on power-up for both the Serial and Latched Parallel modes of operation and will remain in this setting until the user latches in the next programming word.

In Direct Parallel mode, the DSA can be preset to any state within the 31.75 dB range by pre-setting the Parallel control pins prior to power-up.

In this mode, there is a 400 µs delay between the time the DSA is powered-up to the time the desired state is set.

Figure 6. Default Attenuation Word for Power-up state

Programming Options

Parallel Control Mode

The parallel control interface has seven digital control input lines (D6 to D0) to set the attenuation value. D6 is the most significant bit (MSB) that selects the 16 dB attenuator stage, and D0 is the least significant bit (LSB) that selects the 0.25 dB attenuator stage (see Figure 7).

Direct Parallel Mode

For direct parallel mode, The LE pin must be kept HIGH. The attenuation state is changed by the control voltage inputs (D0 to D6) directly. This mode is ideal for manual control of the attenuator. In this mode the device will immediately react to any voltage changes to the parallel control pins [pins 26, 27, 28, 29, 30, 31, 32]. Use direct parallel mode for the fastest settling time.

Latched Parallel Mode

The LE pin must be kept LOW when changing the control voltage inputs (D0 to D6) to set the attenuation state. When the desired state is set, LE must be toggled HIGH to transfer the 7-bit data to the bypass switches of the attenuator array, and then toggled LOW to latch the change into the device until the next desired attenuation change (see Figure 7 and Table 11).

- Set P/S is logic LOW.
- Set LE to logic LOW.
- Adjust pins [26, 27, 28, 29, 30, 31, 32] to the desired attenuation setting. (Note the device will not react to these pins while LE is a logic LOW).
- Pull LE to a logic HIGH. The device will then transition to the attenuation settings reflected by pins D6 - D0.
- If LE is pulled to a logic LOW then the attenuator will not change state.

Latched Parallel Mode implies a default state for when the device is first powered up with P/S pin set for logic LOW and LE logic LOW. In this case the default setting is **Maximum attenuation**.

Switching Feature Description

Glitch-Safe Attenuation State Transient

The BDA4710V/BDA4710VT is the latest product applied *Glitch-Safe* technology with less than 1dB ringing (pos/neg) across the attenuation range when changing attenuation states. This technology protects Amplifiers or ADC during transitions between attenuation states. (see Figure 40,41).

Evaluation board Kit Introduction

BDA4710V/BDA4710VT Evaluation Kit is made up of a combination of an RF board and an interface board

The schematic of the BDA4710V/BDA4710VT evaluation RF board is shown in Figure 57. The BDA4710V/BDA4710VT evaluation RF board is constructed of a 4-layer material with a copper thickness of 1oz(0.035mm) on each layer. Every copper layer is separated with a dielectric material. The top dielectric material is 8 mils RO4003. The middle and bottom dielectric materials are FR-4, used for mechanical strength and overall board thickness of approximately 1.63mm.

BDA4710V/BDA4710VT Evaluation INTERFACE board is assembled with a SP3T switches (D0~D6,LE), SP2T mechanical switch (P/S), and several header & switch.

Evaluation Board Programming Using USB Interface

In order to evaluate the BDA4710V/BDA4710VT performance, the Application Software has to be installed on your computer. And The DSA application software GUI supports Latched Parallel and Serial modes. software can be downloaded from BeRex's website

Serial Control Mode

- Set the Address Jumper (A0, A1, A2) to HIGH or LOW (Refer to Address Table 9)
- Connect directly the Evaluation INTERFACE board USB port(J3) to PC
- Set the direction of P<->S Switch to S direction (P/S Logic HIGH)
- Set the D0~D6,LE switch to the middle position.
- Operate the 0~31.75dB attenuation state in GUI and then control the DSA

Latched Parallel Control Mode

- Connect directly the Evaluation INTERFACE board USB port(J3) to PC
- Set the direction of P<->S Switch to P direction (P/S Logic LOW)
- Set the D0~D6, LE switch to the middle position.
- Operate the 0~31.75dB attenuation state in GUI and then control the DSA

Direct Parallel Control Mode

- Set the direction of P<->S Switch to P direction (P/S Logic LOW)
- Set LE switch to the LOW Position
- For the setting to attenuation state, D0~D6 switches can be combined in manually program, refer to Table 11.

Please refer to user manual for more detailed operation method of BDA4710V/BDA4710VT EVK.

Note: 1. C1 and C2 should be placed near the device.

2. Addressable Pin A0,A1,A2 can be set according to the specified address. If the specified address is 000, All addressable pin(A0,A1,A2) should be grounded.

Figure 62. Packing Outline Dimension

NOTE :

1. Dimensioning and tolerancing conform to ASME Y14.5-2009.
2. All dimensions are in millimeters.
3. N is the total number of terminals.
4. The location of the marked terminal #1 identifier is within the hatched area.
5. ND and NE refer to the number of terminals on each D and E side respectively.
6. Dimension b applies to the metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip. If the terminal has a radius on the other end of it, dimension b should not be measured in that radius area.
7. Coplanarity applies to the terminals and all other bottom surface metallization

ESD / MSL Rating

ESD Rating:	Class 1C
Value:	±1000V
Test:	Human Body Model (HBM)
Standard:	JEDEC Standard JS-001-2017
ESD Rating:	Class C3
Value:	±1000V
Test:	Charged Device Model (CDM)
Standard:	JEDEC Standard JS-002-2018
MSL Rating:	Level 1 at +260°C convection reflow
Standard:	JEDEC Standard J-STD-020

Proper ESD procedures should be followed when handling this device.

RoHS Compliance

This part is compliant with Restrictions on the use of certain Hazardous Substances in Electrical and Electronic Equipment (RoHS) Directive 2011/65/EU as amended by Directive 2015/863/EU.

This product also is compliant with a concentration of the Substances of Very High Concern (SVHC) candidate list which are contained in a quantity of less than 0.1%(w/w) in each components of a product and/or its packaging placed on the European Community market by the BeRex and Suppliers.
